Botao He

botao@umd.edu · botao.me · Google Scholar

Research Profile

I build robots that learn through physical interaction, and real-world systems that make that learning work.

Education

University of Maryland, College Park — Ph.D. in Computer Science Aug. 2022–present
Perception and Robotics Group; advised by Yiannis Aloimonos and Cornelia Fermüller.

Nanjing Institute of Technology — B.Eng. in Robotics Sep. 2018–Jul. 2022

Research & Industry Experience

Amazon Frontier AI & Robotics Team — Research Intern Jan. 2026–present

- Large-scale contact-aware data processing for robot video world model pretraining.
- Developing force-aware dexterous manipulation methods from multimodal human interaction data.
- Exploring physics-grounded, interaction-aware video and world models for robot learning.

Honda Research Institute USA — Research Intern May–Aug. 2025
Developed robust motion prediction using a trainable mixture of model-based and learned experts.

Carnegie Mellon University — Research collaboration May 2023–2025
Interactive navigation and field autonomy; collaborated with Ji Zhang.

Selected Research & Systems

PlayPolicy — dexterity from supervised play
Bootstraps a goal-agnostic play policy from minutes of human play to collect hours of contact-rich data. Play-policy-guided MPC achieves new goals without task-specific demonstrations.

DreamFAR — real-time, long-horizon world simulator
Pre-trained from scratch on robot teleoperation data, with contact-anchored memory that keeps minutes-long autoregressive rollouts consistent.

CARD — contact-anchored dexterous retargeting
Real-time human-to-robot retargeting without object models or simulation, preserving contact and force alongside kinematics.

ForceBand — bring force into human data with EMG, forceful manipulation directly from human data
ForceBand is a low-cost, wrist-worn sEMG band that predicts fingertip forces from forearm muscle activity, enabling force-enriched human demonstrations for learning forceful robot manipulation—without any force sensors on the hand.

FEEL — force-enhanced egocentric dataset ECCV 2026 Long Oral (25/10473)
A large-scale dataset pairing egocentric video with calibrated glove-based force measurements, comprising approximately three million synchronized frames of natural manipulation.

Interactive-FAR & Air-FAR — deployable field autonomy
Built navigation systems for ground and aerial robots operating in complex unknown environments. Interactive-FAR reasons about movable obstacles online; Air-FAR extends fast, adaptable routing to large-scale aerial navigation.

Microsaccade-Inspired Event Camera — sensing hardware and algorithms
Co-designed an actuated event-camera mechanism and computational pipeline that reveals static scene structure while preserving compatibility with established event-based perception methods.

Technical Skills

Learning	Imitation learning, world models, diffusion policies, multimodal learning, online adaptation
Robotics	Dexterous manipulation, motion planning, navigation, active perception, ROS, Gazebo, AirSim, Unity
Programming	Python, C/C++, MATLAB, Git, Linux
Hardware	Custom sensing, embedded systems, STM32/Arduino, SolidWorks, machining, circuit design

Service & Recognition

Reviewing	Science Robotics; IEEE TPAMI; IEEE RA-L; IEEE T-ITS; ICRA; IROS; Frontiers in Robotics and AI
Recognition	NeuroPAC Fellowship (2023, 2024); University of Maryland Dean's Fellowship (2022–2023)
